

The OptimizeIT Enterprise Service is specifically designed to support enterprise application migration to the cloud through providing real application usage analytics that supports decision makers and project managers in assessing suitability and readiness of enterprise applications, plan the migration, monitor the progress and measure the outcome of the transition.

Main functionalities provided by the OptimizeIT Enterprise Service

Application resource profiling:

- CPU usage
- Memory usage
- Network throughput (will be supported during H2/17)

End user activity profiling:

- Total number of connected users
- Segmentation of users to viewers, light users and heavy users
- Users activity by departments
- User activity by locations
- User activity by functional entities
- Legacy productivity suite usage analysis

Application suitability evaluation – the suitability of an application to move to the cloud based on application and user profiling

License optimization

Pilot sampling – select a sample of end users that simulates the users' activity of the whole enterprise

Planning and monitoring of training activities

Ongoing monitoring and measurement of the target cloud environment, including:

- Applications resource utilization
- End-user activity
- End-user experience

OptimizeIT Enterprise enables companies to be far better equipped to make informed decisions, plan and execute their migration strategy to the cloud.
